

true\_type

```
classDiagram
    class true_type {
    }
    class myFunc_IsTupleImpl["myFunc::IsTupleImpl< std::tuple< U... > >"] {
    }
    true_type <|-- myFunc_IsTupleImpl
```

The diagram illustrates a class hierarchy. At the top is a class box for 'true\_type', which is divided into three horizontal sections: the top section contains the name 'true\_type', and the two bottom sections are empty. Below this is a class box for 'myFunc::IsTupleImpl < std::tuple< U... > >', also divided into three horizontal sections: the top section contains the full name, and the two bottom sections are empty. A blue arrow with an open triangular head points from the top section of the 'myFunc::IsTupleImpl' box to the bottom section of the 'true\_type' box, indicating that 'myFunc::IsTupleImpl' inherits from 'true\_type'.

myFunc::IsTupleImpl  
< std::tuple< U... > >
